

Section 5.6
Amplitude, Period, Phase Shift

Draw $y = \sin x$. Then draw $y = \cos x$.

Note that one complete cycle, or period, occurs from 0 to 2π .

Now look at $y = \sin (1/2)x$.

What is the period for this graph?

PERIOD for $y = A\cos (Bx)$, $y = A\sin (Bx)$, $y = A\sec (Bx)$, and $y = A\csc (Bx)$ is: $T = \frac{2\pi}{|B|}$

And AMPLITUDE is: $|A|$

PERIOD for $y = A\tan (Bx)$ and $y = A\cot (Bx)$ is: $T = \frac{\pi}{|B|}$

EXAMPLES: Find the amplitude and period for each function.

1) $y = -2\sin 3t$

2) $y = 3\cos (-2t)$

3) $y = 2\cos t$

4) $y = 2\sin (t + \pi/2)$

Now, let's graph the last two functions on the same axis.

Compare $y = 2\sin (t + \pi/4)$ with $y = 2\cos(t - \pi/4)$.

PERIOD & PHASE SHIFTS

For $y = A\sin(Bx - C)$, $y = A\cos(Bx - C)$, $y = A\sec(Bx - C)$, and $y = A\csc(Bx - C)$

and $B > 0$

the phase shift is found by solving: $Bx - C = 0$

EXAMPLES- Find the amplitude, period, and phase shift for each function.

1) $y = 3\sin(2\pi x - \pi)$

2) $y = -2\cos(3x + \pi)$

In working with function where $B < 0$ it will be helpful to factor out -1 and then use the fact that the function is even or odd.

3) $y = \cos(-2\pi x - \pi)$

4) $y = -2\sin(-3x + \pi/2)$

Now let's work some EGRADE problems.
