

8.4 Vectors

A vector is a line segment with a direction. The length of the vector is called its magnitude.

$||v||$ is the magnitude of v

$2v$ means the vector in the same direction as v with magnitude $2||v||$
 2 is called a scalar

If a scalar is negative, the resulting vector has the opposite direction of v .

Draw $-2v$ on graph paper.

Vectors may be added together.

$v + w$ is shown graphically:

Vectors with an initial point at $(0,0)$ are called *position vectors*.

$v = ai + bj$ components of v are a and b & (a, b) is the terminal point of v

i is a unit vector (its magnitude is 1) in the direction of the positive x-axis
 j is a unit vector (its magnitude is 1) in the direction of the positive y-axis

Vector Operations

For $\mathbf{v} = a_1\mathbf{i} + b_1\mathbf{j}$ and $\mathbf{w} = a_2\mathbf{i} + b_2\mathbf{j}$:

$$\mathbf{v} + \mathbf{w} = (a_1 + a_2)\mathbf{i} + (b_1 + b_2)\mathbf{j}$$

$$\mathbf{v} - \mathbf{w} = (a_1 - a_2)\mathbf{i} + (b_1 - b_2)\mathbf{j}$$

and for scalar α :

$$\alpha\mathbf{v} = (\alpha a_1)\mathbf{i} + (\alpha b_1)\mathbf{j}$$

$$||\mathbf{v}|| = \sqrt{a_1^2 + b_1^2}$$

EXAMPLES

For $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j}$ and $\mathbf{w} = -4\mathbf{i} + \mathbf{j}$, find:

1) $2\mathbf{v} - 3\mathbf{w}$

2) $||\mathbf{v}||$

3) $||2\mathbf{v} - 3\mathbf{w}||$

Unit Vector in the direction of v

$u = \frac{v}{\|v\|}$ is the unit vector (magnitude = 1) in the same direction as v

EXAMPLE: If $v = 3i - 2j$, then what is the unit vector in the same direction as v ?

EXAMPLE of eGrade question #154:

A) If $P = (3,4)$ and $Q = (5, 7)$, then $PQ =$

B) Now find QP .

Note: There are two types of multiplication with vectors. One is scalar multiplication, mentioned in this unit. The second is called a “dot product” of vectors. We will cover that one in 8.5. For now, understand that scalar multiplication produces a new vector, while dot product produces a real number.
