## Exam 4 MAC 2312—Calculus II, Fall 2016

(NEATLY!) PRINT NAME: \_

## Read all of what follows carefully before starting!

- 1. This test has 5 problems (15 parts total), is worth 115 points, and has 1 bonus problem. Please be sure you have all the questions before beginning!
- 2. The exam is closed-note and closed-book. You may **not** consult with other students.
- 3. No calculators may be used on this exam!
- 4. Show all work clearly in order to receive full credit. Points will be deducted for incorrect work, and unless otherwise stated, no credit will be given for a correct answer without supporting calculations. No work = no credit! (unless otherwise stated)
- 5. You may use appropriate results from class and/or from the textbook <u>as long as</u> you fully and correctly state the result and where it came from.
- 6. You do not need to simplify results, unless otherwise stated.
- 7. There is scratch paper at the end of the exam; you may also use the backs of pages or get more scratch paper from me.
- 8.  $\{a_n\}$  always means  $\{a_n\}_{n=1}^{\infty}$ ,  $\sum a_n$  always means  $\sum_{n=1}^{\infty} a_n$ , and "n!" always means "n factorial."

there is no math on this page

What if Kanye wrote a song about Kanye

called I miss the old Kanye?

Man, that'd be SO Kanye!

1. (5 pts ea.) Provide examples of sequences satisfying the below criteria or state that no such example exists. For each example, describe why the criteria are met; if no example exists, explain why. No credit will be given without justification!

(a) A sequence  $\{a_n\}$  which is increasing, bounded below, and not bounded above.

(b) A sequence  $\{b_n\}$  which is decreasing, bounded, and converges to 4.

- 2. Consider the sequence  $\left\{\frac{25}{9}, -\frac{5}{3}, 1, -\frac{3}{5}, \frac{9}{25}, -\frac{27}{125}, \ldots\right\}$ .
  - (a) (5 pts) Find a formula for the general term  $a_n$ .

(b) (5 *pts*) Compute  $\lim_{n \to \infty} a_n$ .

(c) (5 *pts*) Use part (a) to write the series  $a_1 + a_2 + a_3 + \cdots$  in summation notation.

Part (c) is on the next page

(d) (5 *pts*) Write the partial sums  $s_1$ ,  $s_2$ , and  $s_4$  as fractions in reduced form. Simplify fully!

(e) (10 pts) Does the series from part (c) converge? Why or why not? If it converges, find its value. No credit will be given without justification!

3. (a) (5 pts ea.) Explain why you can't use the integral test to determine the convergence of each of the following series. There may be more than one reason why the integral test cannot be used!

i.) 
$$\sum_{n=1}^{\infty} \frac{\cos \pi n}{\sqrt{n}}$$

ii.) 
$$\sum_{k=1}^{\infty} \frac{\cos^2(k)}{1+k^2}$$

Part (b) is on the next page

(b) (10 pts) Use the integral test to determine whether  $\sum_{n=1}^{\infty} \frac{1}{n^2 + 4}$  converges or diverges.

- 4. All parts of this question relate to the series  $\sum_{k=1}^{\infty} \frac{(-1)^k}{k}$ .
  - (a)  $(5 \ pts)$  Show that the ratio test is inconclusive for this series.

(b) (10 pts) Show that this series is (conditionally) convergent.

(c) (10 pts) Is this series absolutely convergent? Why or why not? No credit will be given without justification!

5. (10 pts ea.) Using any of the methods we discussed in class, determine whether each of following series is convergent or divergent.

(a) 
$$\sum_{n=1}^{\infty} \left(\frac{2^n}{n+1}\right)^n$$

SOLUTION:

Part (b) is on the next page

(b) 
$$\sum_{n=1}^{\infty} \frac{n!}{n^n}$$
 Hint:  $\lim_{n \to \infty} \left(1 - \frac{1}{n+1}\right)^n = \frac{1}{e}$ 

SOLUTION:

Part (c) is on the next page

(c) 
$$\sum_{n=1}^{\infty} \frac{\sin(n^2)}{1+4^n}$$

## SOLUTION:

**Bonus** (10 pts): Recall "the  $\varepsilon$ -definition" of sequence convergence:

**<u>The</u>**  $\varepsilon$ -definition: A sequence  $\{a_n\}$  converges to a number L if, for all  $\varepsilon > 0$ , there exists an integer N such that  $|a_n - L| < \varepsilon$  for all  $n \ge N$ .

Prove that the sequence  $\{1 - 1/n\}_{n=1}^{\infty}$  converges to L = 1 using the  $\varepsilon$ -definition by (a) letting  $\varepsilon$  be arbitrary, (b) considering the inequality  $|a_N - 1| < \varepsilon$ , and (c) solving for N.

**Hint**: Your first sentence should be: "Let  $\varepsilon > 0$  be arbitrary and consider the inequality  $|a_N - 1| < \varepsilon$ ."

SOLUTION:

Scratch Paper
