

7.3. MAXIMA MINIMA

Theorem 7.3.1. Let $z = f(x, y)$ be a function of two variables.

GIVEN:

(1) $f_x(a, b) = 0$ and $f_y(a, b) = 0$ ((a, b) is a _____ for f)

(2) All second partial derivative exist around the point (a, b) .

(3) $A = f_{xx}(a, b)$, $B = f_{xy}(a, b)$, $C = f_{yy}(a, b)$

THEN:

case 1: If $AC - B^2 > 0$ and $A < 0$, then $f(a, b)$ is a _____

case 2: If $AC - B^2 > 0$ and $A > 0$, then $f(a, b)$ is a _____

case 3: If $AC - B^2 < 0$, then f has a _____ at (a, b) .

case 4: If $AC - B^2 = 0$ the test fails - _____

Examples

Example 7.3.1. Find all local extrema and saddle points of $f(x, y) = 2x^2 - 2xy + y^2 - 4x + 6y - 3$

Example 7.3.2. Find all local extrema and saddle points of $f(x, y) = 8x + 6y - 17$

Example 7.3.3. Find all local extrema and saddle points of $f(x, y) = -2x^2 + 4xy - 3y^2 - 4x + 2y - 3$

Example 7.3.4. Find all local extrema and saddle points of $f(x, y) = xy + x - y$

Example 7.3.5. Find all local extrema and saddle points of $f(x, y) = 3y^2 - 2x^3 - 24x - 3y - 21$

Example 7.3.6. Find all local extrema and saddle points of $f(x, y) = 2x^3 - 2xy + 2y$

Example 7.3.7. Find all local extrema and saddle points of $f(x, y) = x^3 - 15xy + y^3$

Example 7.3.8. Let $z = f(x, y)$ have a critical point at $(-1, 3)$ and $f_{xx}(-1, 3) = 32$, $f_{xy}(-1, 3) = -4$, $f_{yy}(-1, 3) = \frac{1}{2}$ then $f(-1, 3)$ is a

- a) local max
- b) local min
- c) saddle point
- d) test failed
- e) no local extrema or saddle point

Example 7.3.9. *The cost function, C (in hundreds of dollars), of producing two products is $C(x, y) = 2x^2 + 3y^2 - 4xy + 4x - 8y + 20$, where x is the quantity of product A and y is the quantity of product B.*

(1) *How many of each product should be produced to minimize cost*

(2) *Find the minimum cost of producing these products.*
