

Curvature, Roughly

Christopher A. Stover
cstover@math.fsu.edu

WHAT IS CURVATURE?

Roughly speaking, curvature is a mathematical device which quantifies how “not flat” something is:

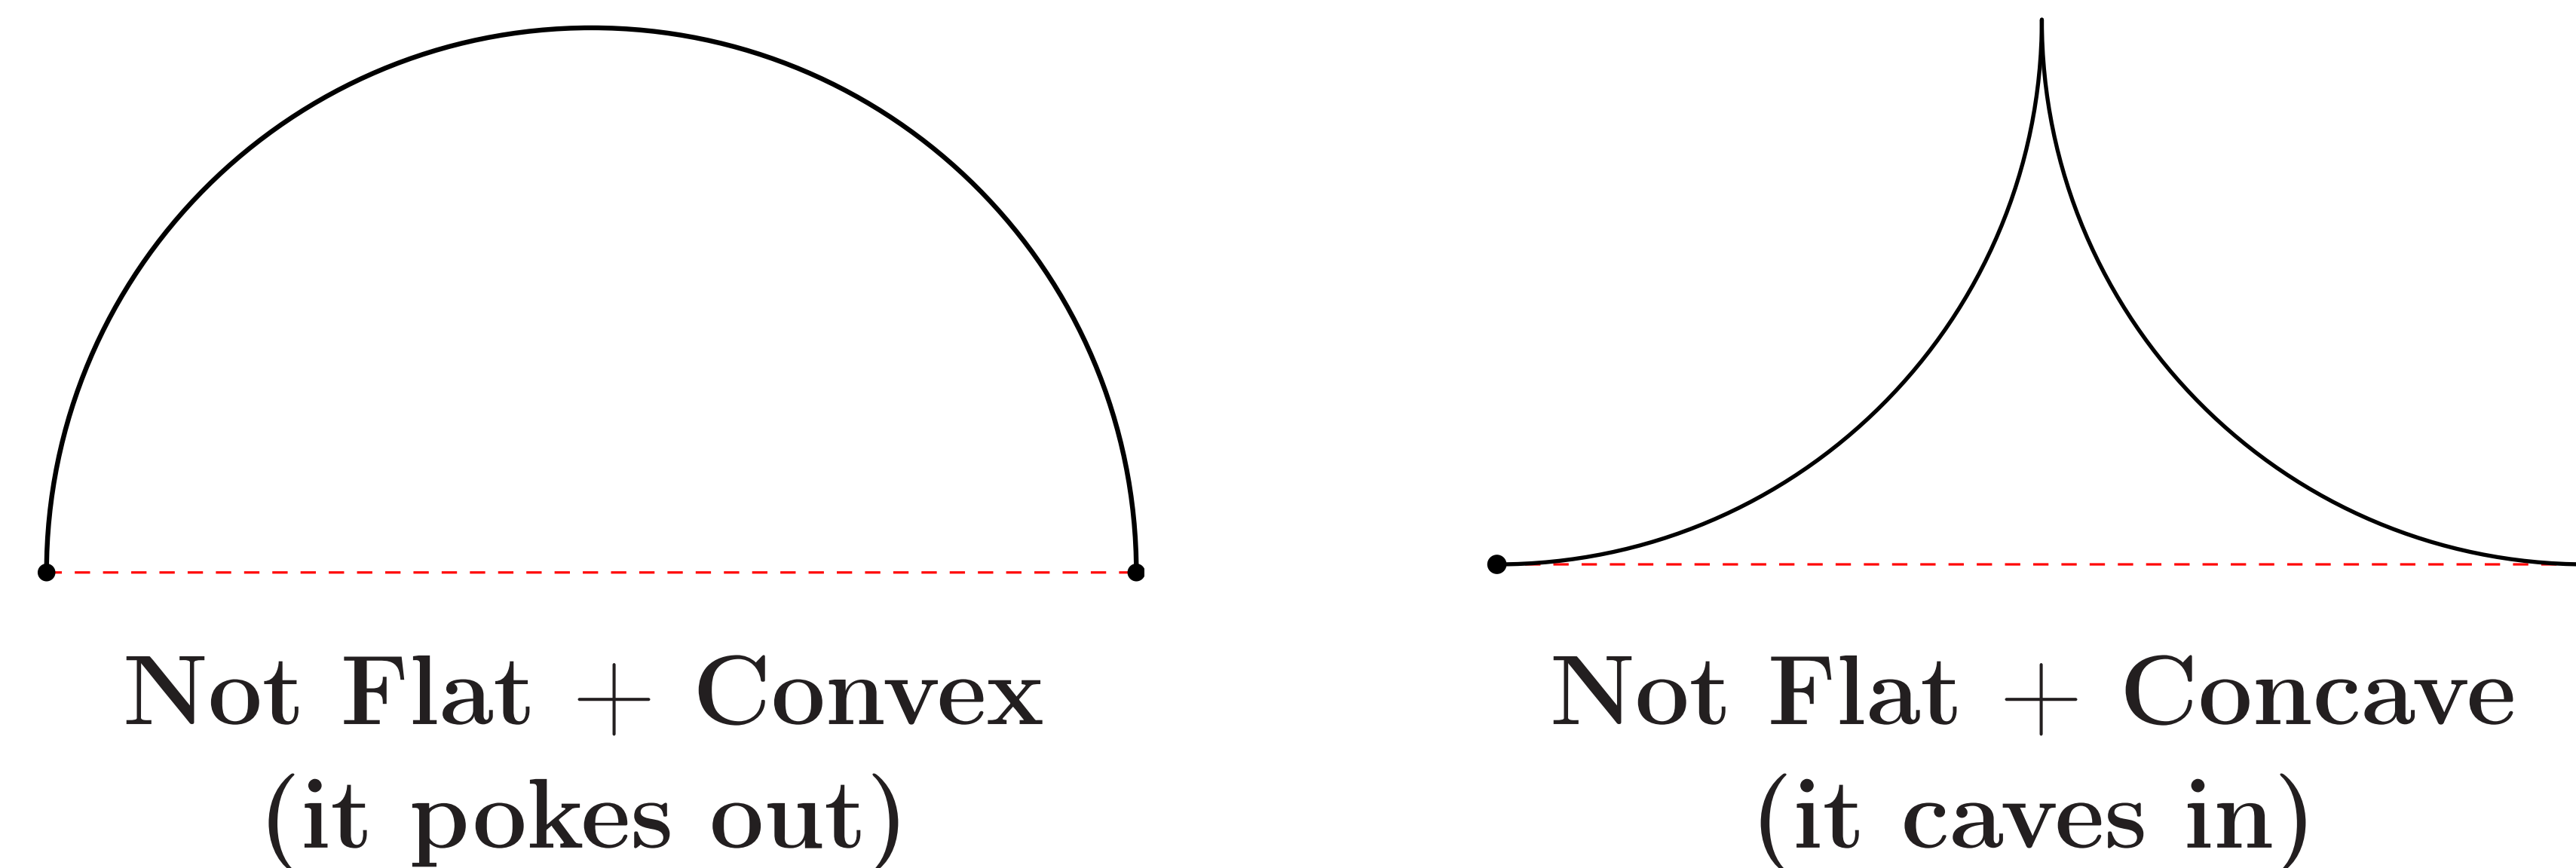

GENERALIZATIONS

These ideas generalize to higher dimensions as well:

QUANTIFYING CURVATURE

In particular, there are different kinds of “not flat”:

This can be made mathematically precise:

Roughly speaking, flat things are said to have *zero curvature* while things which are not-flat and convex are *positively curved* and those which are non-flat and concave are *negatively curved*:

EXAMPLE: THE TORUS

Higher dimensions are more difficult because objects are often visualized in a distorted manner. For example, the torus (a hollowed-out donut):

WHY DO WE CARE?

Because: Curvature is *everywhere* and is still widely-studied!
